# 1 Overview

This document provides a complete system design for a Secure Authentication & Threat Detection Service. This backend web service manages user authentication, logs all authentication events, and performs rule-based analysis to identify suspicious activity such as brute-force attempts, unusual login locations, or impossible-travel logins. The system includes admin endpoints to retrieve logs and alerts and can optionally include a frontend dashboard.

## 2 System Architecture

The system architecture consists of the following components:

- Frontend
- Backend API
- PostgreSQL database
- Redis cache for rate limiting and ephemeral data
- Threat detection engine

## 3 Core Features

- Secure user signup and login
- Password hashing (bcrypt/argon2)
- JWT-based access and refresh tokens
- Role-based authorization
- Logging of authentication attempts
- IP and device tracking
- Redis-based rate limiting
- Rule-based threat detection
- Admin endpoints for logs and alerts

## 4 API Endpoints

Endpoint	Method	Description
/auth/signup	POST	Create a new user account
/auth/login	POST	Authenticate user and issue tokens
/auth/refresh	POST	Refresh access token
/auth/me	GET	Retrieve authenticated user profile
/admin/logs	GET	Retrieve login attempts
/admin/alerts	GET	Retrieve suspicious activity alerts

## 5 Database Schema

### 5.1 users Table

- id (PK)
- email
- password\_hash
- role
- created\_at
- updated\_at

### 5.2 login\_attempts Table

- id (PK)
- user\_id (nullable)
- email\_entered
- ip\_address
- user\_agent
- success (boolean)
- timestamp

### 5.3 alerts Table

- id (PK)
- type
- description
- user\_id (nullable)
- ip\_address
- created\_at
- resolved (boolean)

## 6 Threat Detection Logic

Threat detection is performed using rule-based evaluation.

- 3+ failed attempts from the same IP address
- Logging in from an new location
- Successive logins from differing locations
- Multiple account access from tthe same IP

## 7 Project Structure

```
secure-auth-threat-detection/  
  backend/  
    src/  
      controllers/  
      middleware/  
      services/  
      models/  
      routes/  
    tests/  
    Dockerfile  
    docker-compose.yml  
  frontend/  
    src/  
      users/  
      admin/
```

## 8 Deployment

- Local Docker-based development
- Cloud hosting on Render
- GitHub Pages for documentation and frontend only
